

## Appendix F

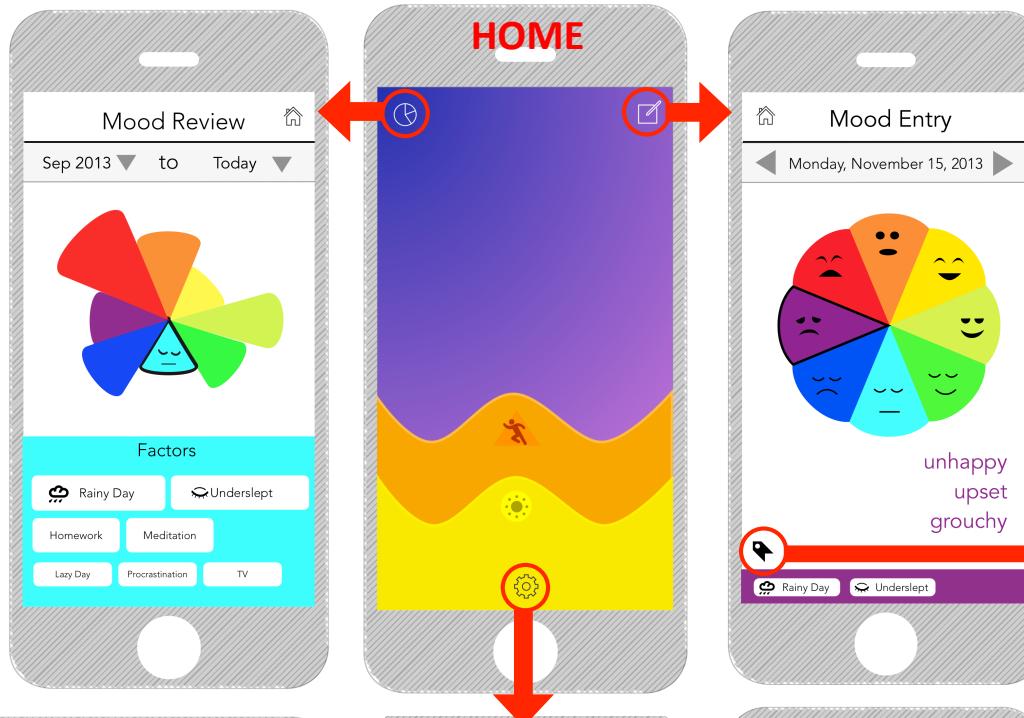

### Moodwave Design Overview

See mood distribution and correlations (tracks and tags) over a specific time period.

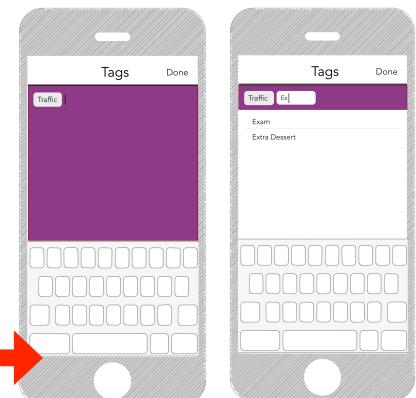

Tracker feedback. See where tracks are on the circumplex based on average mood associations. Trackers near center are neutral. Those near edges have strong influence on mood.

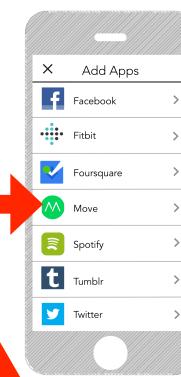

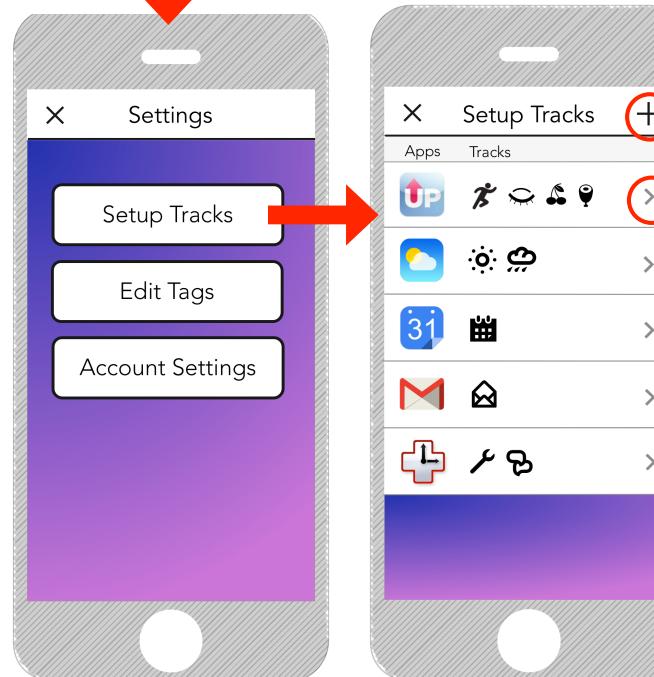

Drag history slider and tracks will move according to how correlations have changed over time.

Add tags. As user types, previously used tags will appear for quick selection.

Connect apps and control what data is automatically tracked.

Individual tracks for an app can be enabled or disabled.
